

Keep Your Teams Connected with Yealink and Ribbon

Microsoft Teams

Microsoft Office 365

You don't have to wait for all of your employees to move to Microsoft Teams to take advantage of native Teams phones.

Businesses are excited about the communications and collaboration aspect of Microsoft Teams. Yealink Microsoft Teams SIP phones run the Teams client, providing real-time communications through a familiar user experience. Simply connecting your smart business phone to the Microsoft Phone System provides convenience when joining a conference call using Yealink Optima HD Voice.

Accessing Teams calling capabilities from a desk or conference phone is a stated goal for many organizations, but the move from an existing PBX does not happen overnight. While the migration to Teams Calling happens in groups, the purchase of phones does not. This leaves organizations in a position where they believe they need to wait until all of their employees are migrated to Teams Calling before they can deploy phones that natively run the Teams client. Ribbon and Yealink have come up with a solution where fully-featured Teams phones can be deployed before the migration is completed. Yealink T56A and T58A desk phones, as well as CP960 conference phones, use Ribbon session border controllers (SBCs) to route phone calls in the absence of the Phone System. You can deploy Yealink Teams phones today and take advantage of their complete set of capabilities as employees are migrated.

Communication is key to any good business. Any disruption to that capability is a disruption to your organization's revenue.

The ability to route calls can be lost when the connection to the Phone System is disrupted by a WAN failure. This immediately affects your organization's ability to create revenue. The same functionality that provides calling capabilities before employees are migrated to Teams provides survivability when the connection is interrupted. **Pairing Yealink phones with Ribbon session border controllers (SBCs) keeps your lines of communication open in the event of an interruption in WAN connectivity.**

How Ribbon SBCs Provide Yealink T56A/T58A Survivability for Microsoft Teams

As a backup to the Phone System, Yealink T56A, T58A desk phones and CP960 conference phone can be configured to use Ribbon Communications SBCs as a registrar. This provides a failover if the connection to the Phone System is interrupted.

When the connection to the Phone System is interrupted, users can switch to a dial pad and have their calls routed through the SBC. Your Yealink phones will be able to make calls to colleagues in the building over the LAN and to those outside the building through the SBC's connection to the telephone network.

Switching between two apps

Easy to switch - the phone will offer a Quick Ball for one-click-switching between the Teams and Survivability APPs.

Key features

Place a call, search contacts, and view history record on the main screen. Added flexibility with 12 registration accounts and relative configurations on website.

Calling Features

Support for complete calling features including call mute, call hold, call transfer, call forward, etc. Ability to set up conference calls and manage participants during the call.
